

KETO-TSUCHI - JAPANESE PEAT MUCK - KOKEDAMA SOIL

Often called Japanese peat clay or peat muck. This unique product is neither peat or clay. Keto comes from rotting vegetation lying deep in waterlogged ground, typically rice paddies. The material has soft clay like qualities but unlike clay will not cause water to puddle. Use when constructing plantings on slabs or rocks. Use to build a retaining wall to contain standard growing medium and create landscape profiles prior to the application of moss covering. In time the trees roots will grow into the Keto and moss and bind everything together.
